A METHOD FOR REMOVING MERCURY FROM WASTE GAS

FIELD OF THE INVENTION

The present invention relates to a method for removing mercury from waste gases.

BACKGROUND OF THE INVENTION

5 Industrially developed countries generate billions of tons of air pollutants, a great part accounts to the combustion of coal, oil, and gasoline in electric power plants. Other major air pollution sources include petroleum refineries, cement plants and petrochemical plants.

10 Hg (mercury) is a naturally occurring metal used in a wide variety of applications ranging from the production of household bleach to the mining of gold. Hg is released into the environment either directly to water via waste systems, or much more commonly, directed to the atmosphere. It is this atmospheric pathway that is largely responsible for Hg contamination in the environment. The
15 combustion of coal for energy production, and incineration of municipal and medical wastes, produces the majority of Hg deposited onto the watersheds.

In the atmosphere, Hg undergoes a wide variety of chemical transformations, eventually settling to the landscape as Hg attached to particulate matter such as soot. Once on the ground, Hg migrates through watersheds, arriving
20 eventually into receiving waters (e.g. wetlands and lakes). Hg that is moving through watersheds is subject to myriad chemical transformations, and these are often biologically mediated. The most important of these biological transformations

- 2 -

is the generation of methyl-mercury (Me-Hg). Me-Hg is a highly toxic form of Hg, which is easily assimilated into tiny planktonic organisms at the base of aquatic food chains. Through the processes of bio-magnification, minute concentrations of Me-Hg are passed up food chains, increasing to levels that pose a significant threat
5 to those organisms feeding at the top of the aquatic food web. Organisms which are at risk of Me-Hg exposure include top-level carnivorous fish such as walleye, fish-eating birds such as eagle and loons, and, of course, humans. It is noteworthy that some fish species are better at getting rid of their Me-Hg burden than others.

The increasing environmental awareness during the last decades has led in
10 many countries to governmental regulations, enforcing standards for maximum air pollutants emission on power plants and industries, in order to achieve air quality standards for various hazard materials. For example, in the U.S., the Clean Air Act of 1967 as amended in 1970, 1977, and 1990 is the legal basis for air-pollution control throughout the U.S.

15 The need to obey these regulations has led to the development of diversified methods for controlling and reducing the emission of air pollutants. In general, these methods include removing the hazardous material before it is used (for example, using low-content sulfur coal) or removing the pollutant after it is formed. For some air pollutants, only methods of the second class can be
20 employed.

The present invention relates to methods of the second class.

Industrially emitted pollutant gases can be entrapped by liquids or solids traps that adsorb the harmful gases before they are released into the atmosphere. These traps are usually in the form of tower tanks contactors through which the
25 waste gas is passed upward while the liquid, or a slurry, i.e. a mixture of liquids and solids, is descending downward. The agent which absorbs the pollutants and prevents their emitting into the atmosphere is called the scrubbing agent. When this agent is a liquid, it is sometimes the practice to fill the tower with inert particles in order to increase the contact surface between the scrubbing agent and the waste gas

- 3 -

and to increase the residence time of the gas inside the reactor. In such cases it is also the practice to circulate the liquid scrubbing agent through the reactor until it is loaded with the pollutants.

SUMMARY OF THE INVENTION

5 The present invention relates to a method for removing mercury (Hg) gas (vapors) , from waste gases by contacting the waste gas with a scrubbing agent being organic sulfoxides either in pure form or as with an emulsion of water-in-organic sulfoxides.

10 The waste gas can be any waste gas containing mercury gases or mercury vapors, such as combustion flue gas and waste gases generated in various chemical and industrial processes.

15 The organic sulfoxides are preferably oil-derived sulfoxides and in particular sulfoxides derived from diesel. The weight ratio of the water: organic sulfoxide in the emulsion is in the range 10:90 to 90: 10, preferably in the range 10:90 to 50:50, most preferably 70% sulfoxide to 30% w/w of water.

20 The process of the present invention is carried out in an oxidation environment. Therefore if the waste gas mixture does not contain enough oxygen, an additional stream of air enriched with ozone (ozonated air) is added to the waste gas. . Alternatively, oxidized water H_2O_2 may be used as the oxidation agent. In such a case the process may be used to eliminate Hg , as well as elimination of other toxic gases such as SO_2 and NO_2 .

25 Where a water-in-organic sulfoxide emulsion is used the scrubbing agent can be regenerated after it is loaded, by letting said emulsion separate into two phases, collecting the upper sulfoxide phase and adding to said sulfoxide phase a fresh amount of aqueous solution.

According to the present invention, contacting the waste gas with the scrubbing agent can be conducted in a tower embedded with inert particles, wherein the waste gas is passed upward through the tower and the pure organic sulfoxide or

- 4 -

the emulsion or water-in-organic sulfoxide is circulated downward in a rate which ensures complete wetting of inert particles or can be conducted in a tower through which the waste gas is passed in an upward direction and the emulsion is sprayed into the tower from the upper opening of the tower forming a fog of said
5 emulsion inside the tower.

DETAILED DESCRIPTION OF THE INVENTION

Organic sulfoxides are known for their acid extraction properties. Of special interest are oil derived sulfoxides that are obtained by the oxidation of organic sulfides contained in oil. By oxidizing and extracting different fractions of oil, a
10 mixture of sulfoxides is obtained, having molecular weight and boiling temperature according to the oil fraction from which they are derived. The diesel fraction (boiling temperature 190-360°C) is in particular a good source for oil-derived-sulfoxides, since this fraction is relatively rich in sulfur and the sulfoxide mixture so obtained is a liquid of low-cost.

15 EXAMPLES

The following experiments demonstrate and clarify the present invention and do not intend to limit the scope of the invention by any way.

Example 1

In a glass tube having the following size: 500 mn length, diameter 30 mn,
20 70 ml sulfoxide were introduced into the glass tube. Air was blown from the compressor through the column at a rate of 1.5 l/min. Additional mercury (Hg) vapor (58 µg) were added to the original air blown. The mercury concentrations after contact with sulfoxide in the column were reduced to 0 microgram, meaning that virtually all the mercury was removed.

25 Mercury concentrations was determined according to EPA-101A Method by absorbing in $\text{KMnO}_4/\text{H}_2\text{SO}_4$ solution and atomic absorption cold vapor analysts).

- 5 -

Example 2

The same procedure as in Example 1 was repeated, but instead of pure sulfoxide a mixture 35 ml sulfoxide + 35 ml doucane (high boiling point aliphatic hydrocarbon solvent) was used. Mercury vapor concentration in air was 45
5 microgram before removal by column, and 0 microgram after column removal , so that here again all mercury was removed.

Example 3

The same procedure as in Example 1 was repeated, but instead of pure sulfoxide liquid emulsion containing 70 ml sulfoxide + 30 ml water was used.

10 Mercury vapor concentration before column removal was 58 microgram, and after column removal , 0 microgram so that in this example as well all mercury was eliminated.

Example 4

The same procedure as in Example 3 was repeated but instead of air and
15 mercury vapor, a mixture of air with SO₂ and mercury vapor: 1.5 l/mn air + 1000 ppm, SO₄ + 58 microgram Hg was used.

pH in water phase was 4 - 6;

SO₂ absorption was by the column was 90%, Hg concentration after column was 0 microgram so that here as well all Hg was absorbed .

20 Example 5

The same procedure as in Example 4 was used, but instead of air, SO₂ and Kg vapors the following was used: air – 1.5 l/min. SO₂ – 1000 ppm, NO₂-150 ppm, NO – 100 ppm, Hg – 58 microgram/m³; pH water phase was 4 ÷ 6;

SO₂ absorption after column was 90%; NO₂ absorption after column was
25 75%;

NO₂ absorption was 50%.

Mercury concentration was 0 microgram after column scrubbing.

- 6 -

Example 6

The same procedure as in Example 2 was used, but instead of sulfoxide – doucan solution organic phase of sulfoxide (70 ml) with 30 ml water were emulsified and used . Mercury concentration before column was 135 5 microgram/m³, after column – 0 microgram/m³.

As can be seen from the above the method of the invention was capable of eliminating virtually all mercury vapors.

Additional Experimental Data

10 Additional experimental data is attached in the following tables 1.1 – 1.5 and 2.1 – 2.3 of the Mercury Vapours Absorbtion Experiment performed according to the following details:

The Purpose of Experiment: To test the Mercury Vapours Absorbtion Efficiency by Laboratory-Scale Column with Absorbtion Liquids according to the present invention.

Test Methods: 1. Mercury Vapours Analyser.
2. Mercury Vapours Determination, based on EPA-101A Method.
(absorbing in KMnO₄/H₂SO₄ Solution and Atomic Absorbtion Cold Vapours Analysis).

Instruments and Apparates: 1. JEROME Mercury Vapours Analyser.
Low Detection Level - 1 mcg/m³ of Mercury Vapours.
2. Personal Sampling Pumps (SKC AirChek-52, Flow Controller)
3. BIOS DRICAL 5.0 Flowrate Calibrator (0.0001 L/min, Primary Standard).
4. Midget Bubblers (Supelco, BoroSilicate Glass, 25 ml "dead volume").
5. Mercury Vapours Generator.
6. Lextran lab-scale Column (Absorber).

Final Results.

1. Measurements by JEROME Mercury Vapours Analyser.

1.1. Absorbing Solution: DAUKAN + 30% Water Emulsion.

Measure	Time	Mercury Vapours Conc-n	Remarks
No.	HH:mm	mcg/m3
